This paper presents the input convex neural network architecture. These are scalar-valued (potentially deep) neural networks with constraints on the network parameters such that the output of the network is a convex function of (some of) the inputs. The networks allow for efficient inference via optimization over some inputs to the network given others, and can be applied to settings including structured prediction, data imputation, reinforcement learning, and others.

In this paper, we propose to use specifically designed neural network to tackle the learning and optimization problem together. In the training stage, the proposed input convex neural network learns the mapping between the power injections and the voltages. In the voltage regulation stage, such trained network can find the optimal reactive power injections by design.

This involves learning two convex functions, by solving a novel minimax optimization. Building upon recent advances in the field of input convex neural networks, we propose a new framework where the gradient of one convex function represents the optimal transport mapping. Numerical experiments confirm that we learn the optimal transport mapping.

1) We constrain the neural network to have an input convex structure, which allows the model to generalize well. The guarantees on generalization performance are given in Theorem 5.4 and Theorem 5.5. These theorems prove our method can generalize to testing data points from spaces unseen in the training process. The effectiveness of

Input convex neural networks (ICNNs) are a class of scalar-valued neural networks  $f(x; \theta)$  such that the function  $x \mapsto f(x; \theta)$  is convex. The neural network architecture for an ICNN is as follows. Given an input  $x \in \mathbb{R}^d$ , the mapping  $x \mapsto f(x; \theta)$  is given by a  $L$ -layer feed-forward NN using the following equations for  $l = 0, 1, \dots, L-1$ :

Input Convex Neural Networks for Optimal Voltage Regulation. Feb 19, 2020. The increasing penetration of renewables in distribution networks calls for faster and more advanced voltage regulation strategies. A promising approach is to formulate the problem as an optimization problem, where the optimal reactive power injection from inverters are calculated to maintain the voltages while satisfying power network constraints.
